1. The six clauses that are used in a SQL retrieval query are Select, From, Group By, Order By, Having, Where. Select and From are required by any query as it defines what needs to be selected and from where exactly. The rest are optional as they are used for getting a little more detail towards the data like ascending order, or departments are grouped together etc.

2. Define (Left, Right and Full Outer Joins | Aggregate | Triggers | Assertions)

3. DIAGRAMS / RELATIONSHIPS FOR EACH

   a. Superclass/subclass relationship
   b. IS-A Relationship
   c. Specialization and Generalization
   d. 3 Binary relationships
   e. Ternary relationship
